- Chalk
- Minera Slate Scissors

1. Decide the shape of the slab

A good tip is to lift the slab you are adjusting to and place the slab you want to shape slightly underneath.

Mark it with chalk along the edge. This will serve as your cutting guide.

2. Cut with scissors

Place the slab into the steel, positioned deep inside the shears' opening, and push it forward as you press down.

It's important to use only the innermost part of the shears, as that's where you get the most power.

3. Tip for removing large sections

If a large portion needs to be removed, it's best to do it in several stages.

Cut a small section first and work gradually until you're about 1–2 cm from the chalk line. Then cut along the line for a perfectly shaped slab.
